## How to setup a DLNA Media Server

The CloudRay SG automatically provides a simple DLNA Media server for any media you place in the “**dlna**” folder on your device. This means you can store all of your music, pictures, and videos on your CRSG, and stream them to any TV or device you like. Furthermore, you can sync some/all of your media to secondary storage, or the cloud, however you like.

Files placed in the “**dlna**” folder (and its subfolders) are automatically rescanned periodically, and will show up to your client devices fairly quickly. If for some reason your media isn't showing up, a rescan is forced upon reboot, so you can restart your appliance to force it to show up.
